SUMMARY

Full-stack software developer specializing in mobile-first fintech and marketplace applications, with production experience across React Native, Flutter, .NET, and Supabase/PostgreSQL. Currently building and shipping a live banking platform serving 6,000+ users on a monthly release cadence, alongside independent contract work architecting Stripe-integrated marketplace apps from the ground up. Master's in Data Science & Analytics with applied machine learning (TensorFlow, Scikit-learn) and a strong track record of using AI development tools (Claude, GitHub Copilot) to accelerate delivery without sacrificing code quality.

SKILLS

Languages & Frameworks: React Native, Expo, React.js, Flutter, JavaScript, TypeScript, HTML5, CSS3, Java, Python, C#, .NET, Spring Boot

Databases & Tools: AWS BedRock, AWS Amplify, Neon, IAM, PostgreSQL, MongoDB, Supabase, ChromaDB, Git, Stripe, Docker, Postman, Swagger, Playwright, Jest, Cucumber, Maestro, Sentry, Power BI, Tableau

ML & Data: TensorFlow, Scikit-learn, Pandas, Jupyter Notebooks, FastAPI

AI & Prompt Engineering: Claude (Anthropic API), OpenAI API, LangChain, Antigravity, Cursor, GitHub Copilot, Prompt Engineering

Certifications: Google Cloud Platform Certification, AWS Cloud Practitioner Certification

EXPERIENCE

Worldwide Interactive Services — Software Developer

Aug 2025 – Present

Milly — OLB Browser Platform & Mobile Banking Application([App Link](#) , [Web Link](#))

Aug 2025 – Present

- Develop and maintain a full-featured browser and mobile banking platform live with 6,000+ active users, shipping monthly features and security releases since April 2026.
- Built responsive UI screens using React, React Native, Expo Go, Tailwind, and NativeWind for registration, fund transfers, deposits, and bill payment flows.
- Designed and implemented an end-to-end customer onboarding flow with real-time ID verification and remote deposit using MiSnap ensuring secure user registration as well as Check deposits.
- Integrated the platform's bill pay module with iPay, supporting one-time and recurring bill payments, payee management, and payment status tracking across the mobile and browser experiences.
- Built the eStatements feature enabling users to preview and download monthly statements for each individual card account, giving users self-service access to statement history.
- Integrated Sentry for proactive error tracking and monitoring; the most recent monthly release measurably reduced client-reported bugs compared to the prior cycle.
- Improved release stability by building an automated regression testing suite with Playwright, run ahead of every monthly deployment.
- Maintained banking compliance standards across releases by auditing and updating project dependencies and security patches.
- Analyzed user behavior and app performance metrics to identify usage patterns and guide UX improvements.

FivePoints — CoBRIS App for Social Workers (completed, transitioned to client team)

Jan 2026 – Jun 2026

- Developed a cross-platform child welfare case management app (CoBRIS/Clover) using React Native, Expo, and TypeScript for Android and iOS from a single codebase.
- Implemented secure token storage with silent JWT refresh and biometric re-authentication (Face ID, Fingerprint, PIN) via expo-local-authentication and expo-secure-store.
- Built an offline-first architecture with a SecureStore-backed queue that auto-detects connectivity and flushes queued submissions once back online.
- Implemented a persistent no-connectivity banner displayed across the screen to alert caseworkers in real time when the device lost network connection, reinforcing trust in the offline-first submission flow.
- Engineered a session-timeout screen with live countdown, auto-biometric prompt, and graceful logout/re-authentication flow; configured Expo Router with protected routes and auth guards.
- Delivered the completed application and handed off ownership to the FivePoints engineering team at project close.

Zest Kid — Kids Activity Marketplace

May 2026 – Present

- Building a cross-platform Flutter marketplace connecting parents with independent class vendors and coaches managing their own classes, schedules, and earnings, using Claude (Anthropic) as an AI development partner throughout the build.
- Architected the full backend on Supabase: Postgres database, Row Level Security for multi-tenant data isolation, Storage for media uploads, and Auth for role-based user management.
- Integrated Stripe Connect end-to-end: PaymentIntents for class bookings, automated platform revenue splits, and recurring subscription billing for business accounts.
- Deployed Supabase Edge Functions (TypeScript/Deno) to handle payment processing and Stripe webhook events server-side, keeping credentials off the client.
- Implemented a financial dashboard with monthly earnings summaries, revenue-by-class breakdowns, and Stripe Connect payout management.
- Currently demoing the platform to prospective business clients and iterating the roadmap based on their feedback.
- Followed TDD across auth, classes, payments, subscriptions, and booking flows using flutter_test and mocktail, covering controllers, repositories, CSV parsing logic, and key UI screens.

Capgemini Private Limited — Software Analyst

Apr 2022 – Sep 2023

Fraud Detection System — State Co-operative Bank (Apache Fineract)

- Engineered an ML-based fraud detection system to flag suspicious transactions, reducing manual review overhead and improving detection accuracy across multi-tenant bank deployments.
- Built an end-to-end data pipeline using Python (pandas, scikit-learn) and SQL to analyze account data, detect fraud patterns, and identify customer anomalies.
- Integrated trained ML models into a Spring Boot microservices backend with real-time fraud alert APIs and configurable detection rules per institution.
- Delivered executive dashboards in Power BI and PostgreSQL, enabling compliance and risk teams to manage alerts across multiple bank clients.

PROJECTS

Mobile Banking App with AI (GitHub: [Banking App](#), [Link to the website](#))

Feb 2026 – Present

- Designed a cross-platform mobile banking app with AWS Amplify for authentication, hosting, and CI/CD pipelines, replacing manual deployment with fully automated cloud delivery to streamline the release cycle.
- Integrated Amazon Bedrock (Claude/Titan models) to power an embedded AI financial advisor, enabling real-time spending analysis, budget recommendations, and natural-language Q&A — replacing a static chatbot with a foundation-model-backed conversational engine.
- Migrated the database layer to Neon (serverless PostgreSQL) with branching workflows for isolated dev/staging/prod environments, enabling zero-downtime schema migrations and cost-efficient autoscaling.
- Containerized the .NET 9.0 RESTful API using Docker and deployed it via AWS ECS (Fargate), achieving environment parity across local development and cloud production and eliminating "works on my machine" issues.
- Built secure RESTful APIs with Entity Framework Core and Neon PostgreSQL to manage accounts, transactions, budget limits, loans, and bill requests — authenticated via JWT + AWS Cognito integration through Amplify.
- Designed a responsive frontend using React Native, Expo SDK 54, TypeScript, NativeWind, and React Native SVG for dynamic charts, connected to AWS AppSync for real-time data synchronization.
- Implemented a global Privacy Mode for sensitive data masking and leveraged AWS Amplify DataStore for offline-first state management and conflict resolution.
- Secured the app with BCrypt password hashing, AWS Cognito for identity management (MFA-ready), and Expo SecureStore for on-device token storage — achieving defense-in-depth across the auth stack.
- Engineered Amazon Bedrock Agents with custom action groups to autonomously fetch account balances and transaction history, allowing users to ask "How much did I spend on food last month?" and receive AI-generated insights in natural language.
- Wrote Docker Compose configurations for local development, enabling backend, database (Neon proxy), and AI mock services to spin up with a single command, reducing onboarding time for collaborators.

EDUCATION

Master of Science in Data Science and Analytics (Graduated)

May 2025

Florida Atlantic University | GPA: 3.63 / 4.0
